Thermal Conductivity of selected Materials and Gases. Thermal conductivity of some selected gases, insulation products, aluminum, asphalt, brass, copper, steel and other common materials. Thermal conductivity is a measure of a substance's ability to transfer heat through a material by conduction. Thermal conductivity, k (or λ), measured in $W/m.K$. Thermal Conductivity. The heat transfer characteristics of a solid material are measured by a property called the thermal conductivity, k (or λ), measured in $W/m.K$. It is a measure of a substance's ability to transfer heat through a material by conduction. Thermal conductivity can be defined as the rate at which heat is transferred by conduction through a unit cross-section area of a material, when a temperature gradient exists perpendicular to the area.
