# Preface

This book presents the design of solar thermal systems using mathematical modeling. The importance of mathematical modeling is continuously increasing because of the rapid spread in the use of computers as design tools. The book is thus prepared for those who are involved in the design, optimization, or evaluation of the performance of solar thermal systems.

The book is based on teaching notes for undergraduate and first year graduate courses for thermal engineering students. It is recommended as a text for senior undergraduate students or first year graduate students, and also as a reference book for engineers working in various solar thermal applications.

The book consists of 10 chapters. The first chapter reviews the world resources of energy and their classification and relation to solar energy. The second chapter reviews important topics in thermal radiation which are relevant to the subject of the book. The third chapter is concerned with the estimation of solar angles and the hourly, daily, and monthly average daily solar radiation. Mathematical equations are given to enable the designer of a solar thermal system to estimate the beam, diffuse, or total radiation on horizontal or tilted surfaces.

The transmission of solar radiation through transparent sheets of different material is treated in Chapter 4. This chapter gives mathematical equations to predict the radiation properties of multi-layer partially transparent sheets with or without an absorber plate. A computer program is included to enable the designer to estimate the radiation properties for several geometries of a stack of similar or nonsimilar transparent sheets with or without an absorber plate at any incidence angle. The program is useful in the design and optimization of flat plate collectors and solar concentrators, and can also be utilized by air conditioning engineers to estimate solar heat gain through transparent windows and doors.

Chapter 5 gives the design of flat plate collectors, and presents various types. Complete simulation of the collectors is given, and the various factors affecting their performance are discussed. A computer program is given to design and optimize the design parameters of the flat plate collectors. This program can also be used to evaluate the performance of flat plate collectors in off-design conditions.

Chapter 6 deals with solar desalination. The chapter will be helpful to those designing either roof-type or diffusion-type solar desalination systems, since it includes a more detailed description of these systems than most other solar energy text books. Analysis are given to predict the transient performance of the roof-type still. A computer program is given to assist the designer in predicting the effect of various design and operating conditions on the performance of the still. Various novel designs of roof-types stills are presented with the advantages and disadvantages of each. The chapter also gives the analysis of both the single effect and the multiple-effect diffusion-type still together with a brief presentation of the mass diffusion theory. Other methods of solar desalination are also discussed in the chapter.

The collection of solar energy at medium and high temperatures by solar concentrators is discussed in Chapter 7. Various types of concentrators are presented. Thermal analyses are given to show the important factors affecting the performance of solar concentrators. Different tracking modes are given. The material in this chapter will help the reader to select the type of solar concentrator most suitable for a particular application together with the adequate tracking mode. Details of the designing of intermittent tracking are given in the chapter. Readers interested in continuous tracking will find ample material in section 10.8 of Chapter 10.

In Chapter 8, the design of solar energy storage is considered. The first part of the chapter deals with storage methods, characteristics, location, and the evaluation of the storage process. Mathematical simulations of various types of sensible heat storage are carried out for low, intermediate, and high temperature applications. In particular, mathematical simulations are presented for the transient performance of the mixed liquid storage, underground liquid storage, and stratified liquid storage. With these simulations the reader of the chapter should be able to size the liquid storage tank required for a certain application. Designers of solid storage tanks will also find that the mathematical simulation of rock bed storage and its sizing are covered in the chapter. In addition, other techniques of solar energy storage such as low, intermediate, and high temperature phase change and chemical and mechanical storages are considered. The user of the simulation models given in this chapter should have a reasonable background in the finite difference numerical technique.

The solar-operated absorption cooling system is treated in Chapter 9. Both  $\text{H}_2\text{O}$ -LiBr and  $\text{NH}_3$ - $\text{H}_2\text{O}$  absorption systems are considered. Different arrangements of solar-operated absorption cooling systems are given, together with the criteria to evaluate and compare these systems. Alternative combinations of absorption cooling systems, such as the dual series connected system and the two stage absorption cooling system, are presented. Mathematical simulations of both the  $\text{H}_2\text{O}$ -LiBr and  $\text{NH}_3$ - $\text{H}_2\text{O}$  absorption machines are considered. A computer program is included to predict the performance of the absorption cooling machine in various design and operating conditions. An optimization procedure is given for the determination of the design parameters of the absorption cooling machine. The chapter also contains a brief description of the intermittent absorption cooling system.

Chapter 10 deals with solar power generation. The chapter includes the charac-

teristics required for the working fluids of the solar-operated Rankine cycle. Mathematical simulation is given for the Rankine cycle and selection of the various design parameters of the system is presented. The chapter also includes the performance of the solar-operated Rankine cycle (SORC) in various operating conditions. In addition, the engineering considerations for the selection of the various components of SORC are given. Analyses are also presented to select the optimum collector temperature for solar-operated power cycles. A sizeable section of the chapter is devoted to power tower technology, including material for the determination of the heliostat field layout, the determination of the tilt and orientation angle of each heliostat, and the sizing of the receiver.

The book adds considerably to engineering expertise in the design of solar thermal systems. Chapters 5 and 8 are relevant to the design of solar water heaters, swimming pool heating systems, and space heating. Chapter 6 will also assist in the design of solar desalination systems. Those involved in the design of solar operated absorption cooling systems should read Chapter 9 in addition to Chapter 8 and Chapters 5 or 7. Information on solar power generation is given in Chapter 10 and also in Chapters 7 and 8.

# Contents

## Chapter 1: The World Energy Resources

1.1	The Sun .....	1
1.2	The World Energy Resources .....	2
1.2.1	Coal .....	2
1.2.2	Petroleum Oil and Natural Gas .....	3
1.2.3	Shale Oil and Tar Sand .....	4
1.2.4	Nuclear Fission .....	4
1.2.5	Fast Breeder Reactor .....	4
1.2.6	Nuclear Fusion Energy .....	5
1.2.7	Hydraulic Power .....	5
1.2.8	Wind Power .....	6
1.2.9	Geothermal Energy .....	6
1.2.10	Hydrogen Fuel .....	6
1.3	Solar Energy .....	6
References	.....	10

## Chapter 2: Thermal Radiation

2.1	Introduction .....	13
2.2	Radiation Properties .....	13
2.3	Opaque and Non-Opaque Materials .....	17
2.4	Selective Surfaces .....	19
2.5	Net Radiation Leaving a Gray Surface .....	24
2.6	Intensity of Radiation Leaving a Gray Surface .....	25
2.7	Radiation Exchange between Gray Surfaces .....	26
2.7.1	Exchange between Two Surfaces .....	26
2.7.2	Example: Four Surface Enclosures .....	28
2.7.3	Estimation of Shape Factor .....	28
2.7.4	Special Cases .....	29
2.8	Absorption and Emission of Radiation by Gases .....	34
2.9	Radiation Exchange between Two Gray Surfaces Through Absorbing and Transmitting Mediums .....	35
2.9.1	One Absorbing and Transmitting Medium .....	35
2.9.2	Two Absorbing and Transmitting Mediums .....	37

Nomenclature .....	38
Problems .....	39
References .....	40

### Chapter 3: Solar Radiation

3.1 Introduction .....	41
3.2 Solar Angles .....	41
3.3 Extraterrestrial Solar Radiation .....	48
3.4 Depletion of Solar Radiation .....	51
3.5 Estimation of Solar Radiation Received by a Horizontal Surface .....	54
3.5.1 Clear Sky Models .....	57
3.5.1.1 ASHRAE Model (clear sky) .....	57
3.5.1.2 Hottel Model .....	58
3.5.2 Models Dependent on Local Solar Measurements .....	62
3.5.2.1 Hourly Radiation .....	62
3.5.2.2 Models to Estimate Daily Radiation .....	66
3.5.2.3 Models to Estimate the Monthly-Average Daily Radiation .....	68
3.6 Estimation of Solar Radiation on a Tilted Surface .....	69
3.7 Atmospheric Radiation .....	74
3.8 Measurements of Solar Radiation .....	75
Nomenclature .....	76
Problems .....	77
References .....	80

### Chapter 4: Optical Properties of Materials and Radiation Characteristics of Surfaces

4.1 Introduction .....	83
4.2 Reflectances and Transmittances of Interfaces and Plates .....	84
4.2.1 Interface and Material Properties .....	84
4.2.2 Effective Properties for a Plate .....	86
4.3 Effective Properties of a Stack of Plates .....	89
4.3.1 Incident Radiation on the Outer Surface of the Stack .....	89
4.3.2 Incident Radiation on the Inner Surface of the Stack .....	91
4.4 Effective Properties of an Absorber Plate with N-Cover: Incident Radiation on the Absorber Plate .....	96
4.4.1 An Absorber with One Cover Plate .....	96
4.4.2 An Absorber Plate with N-Covers .....	97
4.5 Effective Properties of an Absorber Plate with N-Cover: Incident Radiation on the Top Cover .....	99
4.6 Computer Programming .....	104
Nomenclature .....	116
Problems .....	117
References .....	117

## Chapter 5: Flat Plate Collectors

5.1	Introduction .....	119
5.2	Types of Flat Plate Collectors .....	120
5.2.1	Liquid Flat Plate Collectors .....	120
5.2.2	Gas Flat Plate Collectors .....	121
5.3	Thermal Analysis of Flat Plate Collectors .....	122
5.3.1	Introduction .....	122
5.3.2	Specifications of the Collector and the Meteorological Parameters .....	124
5.3.3	Radiation Processes in the Collector .....	126
5.3.4	Energy Balance of Different Elements of Collector .....	130
5.3.5	Analytical Method of Solution .....	135
5.3.6	Empirical Formula for Top Loss Coefficient .....	144
5.3.7	Total Loss Coefficient .....	145
5.3.8	Local Temperature Across the Plate .....	146
5.3.9	Collector Efficiency Factor .....	148
5.3.10	Fluid Temperatures and Heat Removal Factor .....	149
5.3.11	Average Plate Temperature .....	151
5.3.12	Outlet Fluid Temperature .....	151
5.4	Factors Affecting the Performance of FPC .....	154
5.4.1	Introduction .....	154
5.4.2	Cover .....	154
5.4.3	Absorber Plate .....	156
5.4.4	Liquid Tubes .....	156
5.4.5	Operating Conditions .....	156
5.4.6	Conclusions .....	157
5.5	Simulation, Design, and Optimization of FPC .....	157
5.6	Simulation and Algorithm of Solution for Liquid FPC .....	158
5.6.1	Nomenclature .....	159
5.6.2	Data .....	161
5.6.3	Steps of Calculation .....	161
5.6.4	Algorithm for Assisting Subroutines .....	162
5.6.5	Checked Program List in Basic Language .....	165
5.6.6	Sample Output .....	177
5.7	Analysis of Solar Air Heaters .....	178
	Problems .....	181
	References .....	184

## Chapter 6: Solar Desalination

6.1	Introduction .....	187
6.2	Definitions .....	188

6.3	Roof-Type Solar Stills (Basin-Type)	189
6.3.1	Construction	189
6.3.2	Thermal Analysis of the Still	193
6.4	Performance Prediction of Roof-Type Stills	198
6.4.1	Generalized Procedure	199
6.4.2	Morse-Read Chart	209
6.4.3	Approximate Solution	211
6.5	The Maximum Efficiency of The Still	213
6.6	Effect of Various Parameters on the Performance of Roof-Type Stills	215
6.6.1	Effect of Solar Radiation	215
6.6.2	Effect of Ambient Temperature	215
6.6.3	Effect of Wind Velocity	215
6.6.4	Effect of Edge and Base Loss Coefficient	216
6.6.5	Brine Depth	216
6.6.6	Vapor Tightness	216
6.6.7	Condensate Leakage	216
6.6.8	Effect of Cover Slope	216
6.6.9	Effect of Gap Distance between Water Surface and Cover	216
6.6.10	Effect of Build-up of Reflecting Layers of Salt on Water Surface and Basin Linear	217
6.7	Novel Designs of Roof-Type Stills	217
6.7.1	Double-Basin Still	217
6.7.2	Basin-Type Stepped Solar Still	217
6.7.3	Wick-Type Collector-Evaporator Still	219
6.7.4	Vertical Microporous Evaporator Solar Still	220
6.7.5	Cascade Solar Still	221
6.7.6	Roof-Type Still with Treated Cover Surface	221
6.7.7	Roof-Type Still with Cover Cooling	222
6.7.8	Double-Effect Tilted Solar Still	222
6.8	Diffusion Stills	224
6.8.1	Introduction to Mass Diffusion	224
6.8.2	Thermal Analysis of Diffusion Stills	227
6.9	Multiple-Effect Diffusion Stills	231
6.10	Comparison of Transient Performance Predictions of a Single-Effect Diffusion Still with a Roof-Type Still	237
6.11	Economics of Solar Stills	243
6.12	Other Types of Solar Desalination Systems	246
6.12.1	Forced Convection Stills	246
6.12.2	Multiple Effect Humidification-Dehumidification	246
6.12.3	Solar Water Recovery from Air	247
	Nomenclature	248
	Problems	249
	References	253

## Chapter 7: Concentrating Collectors

7.1	Introduction .....	255
7.2	Types of Concentrating Collectors .....	255
7.2.1	Planar Reflector .....	259
7.2.2	V-Trough Reflector .....	259
7.2.3	Parabolic Reflector .....	259
7.2.4	Compound Parabolic Concentrator .....	259
7.2.5	Dish Reflector .....	261
7.2.6	Heliostat Reflectors .....	262
7.2.7	Lens Refractor .....	263
7.2.8	Fresnel Lens Refractor .....	263
7.3	Important Factors .....	263
7.4	Concentration Ratio .....	263
7.4.1	Definitions .....	263
7.4.1.1	Aperture Area ( $A_{ap}$ ) .....	264
7.4.1.2	Absorber Area ( $A_{abs}$ ) .....	264
7.4.1.3	Acceptance Angle and Acceptance Half Angle .....	264
7.4.1.4	Theoretical Concentration Ratio $C$ .....	264
7.4.1.5	Actual Concentration Ratio $C_a$ .....	265
7.4.2	Maximum Theoretical Concentration Ratio .....	265
7.4.3	Ideal Concentrators .....	268
7.4.4	Actual Concentrators .....	268
7.5	Tracking Modes .....	268
7.5.1	Solar Profile Angle .....	270
7.5.2	No Tracking Mode .....	270
7.5.3	Intermittent Adjustment of Tilt Angle .....	272
7.5.4	Continuous Tracking About One Axis .....	276
7.5.5	Continuous Tracking About Two Axes .....	277
7.6	Thermal Analysis .....	277
	Nomenclature .....	280
	Problems .....	281
	References .....	284

## Chapter 8: Solar Energy Storage

8.1	General Concepts .....	285
8.1.1	Storage Methods .....	285
8.1.2	Storage Characteristics .....	287
8.1.3	Storage Location .....	287
8.1.4	Storage Efficiency .....	288
8.2	Low Temperature Sensible Storage .....	288
8.2.1	Introduction .....	288
8.2.2	Storage in Liquids .....	290
8.2.2.1	Above Ground Liquid Storage .....	290

8.2.2.2	Underground Liquid Storage .....	291
8.2.2.3	Enhancement of Stratification .....	293
8.2.3	Simulation of Storage in Liquids .....	294
8.2.3.1	Simulation of Mixed Storage .....	295
8.2.3.2	Simulation of Underground Storage .....	297
8.2.3.3	Simulation of Stratified Liquid Storage .....	299
8.2.3.4	Sizing of Liquid Storage Tanks .....	302
8.2.4	Storage in Solids .....	303
8.2.4.1	Rock Bed Storage .....	304
8.2.4.2	In-Ground Storage .....	304
8.2.5	Simulation of Storage in Solids .....	305
8.2.5.1	Simulation of Rock Bed Storage .....	305
8.2.5.2	Sizing of Rock Beds .....	313
8.3	Intermediate and High Temperature Sensible Storage .....	314
8.3.1	Sensible Storage in Fluids .....	314
8.3.2	Sensible Storage in Solids .....	316
8.3.3	Sensible Storage in Fluid-Solid Media .....	316
8.4	Low Temperature Phase Change Storage .....	316
8.4.1	Phase Change Materials .....	317
8.4.2	Systems and Problems .....	317
8.5	Intermediate and High Temperature Phase Change Storage .....	320
8.6	Chemical Storage .....	320
8.7	Mechanical Storage .....	322
	Nomenclature .....	323
	Problems .....	325

## **Chapter 9: Solar Operated Absorption Cooling Systems**

9.1	Introduction .....	329
9.2	Basic Absorption Cooling Cycle .....	329
9.2.1	Description of the Cycle .....	329
9.2.2	Upper and Lower Limits for COP of Irreversible Absorption Cooling Cycle .....	332
9.2.3	Desirable Characteristics of Refrigerant-Absorbent Solution ..	333
9.2.4	Selection of Working Fluids for Solar Operated Absorption Cooling Cycle .....	336
9.2.5	The H <sub>2</sub> O-LiBr and NH <sub>3</sub> -H <sub>2</sub> O Absorption Cooling Machines ..	336
9.3	Different Arrangements of Solar-Operated Absorption Cooling Sys- tems .....	341
9.4	Evaluation of Solar-Operated Absorption Cooling System .....	345
9.4.1	System Thermal Ratio .....	345
9.4.2	Specific Collector Area .....	348
9.5	Some Alternative Absorption Cooling Systems .....	348
9.5.1	Dual Series-Connected System .....	351

9.5.2	Two-Stage Absorption Cooling System .....	352
9.6	Simulation of the Solar-Operated Absorption Cooling Machine .....	355
9.6.1	Introduction .....	355
9.6.2	General Solar-Operated Absorption Cooling System .....	356
9.6.3	Simulation of H <sub>2</sub> O-LiBr Machine .....	359
9.6.4	Simulation of NH <sub>3</sub> -H <sub>2</sub> O Machine .....	361
9.6.5	Mathematical Relations of Thermodynamic Properties .....	362
9.6.6	Design Parameters of Absorption Cooling Machine .....	364
9.6.7	Numerical Prediction of Performance of Absorption Cooling Machine .....	364
9.7	Optimization of Design Parameters of the Absorption Cooling Machine for Solar Applications .....	375
9.8	Solar-Operated Intermittent Absorption Cooling Systems .....	380
	Nomenclature .....	382
	Problems .....	382
	References .....	384

## Chapter 10: Solar Power Generation

10.1	Introduction .....	387
10.2	Thermodynamic Power Cycles .....	388
10.2.1	Ideal Rankine and Reheat Cycles .....	388
10.2.2	Ideal Air-Standard Otto and Diesel Cycles .....	389
10.2.3	Ideal Air-Standard Stirling and Ericson Cycles .....	390
10.2.4	Ideal Air-Standard Brayton Cycle .....	391
10.3	Solar-Operated Rankine Cycle .....	393
10.3.1	Selection of Working Fluid .....	393
10.3.2	Simulation of Solar Operated Rankine Cycle .....	395
10.3.3	Design Parameters of Solar Operated Rankine Cycle .....	398
10.3.3.1	Overall Fluid-to-Fluid Conductance of the Heat Trans- fer Elements .....	398
10.3.3.2	Thermal Capacity of External Flows .....	399
10.3.3.3	Efficiency of Rotating or Moving Elements .....	400
10.3.3.4	External Temperatures .....	400
10.3.4	Performance of Solar Operated Rankine Cycle .....	401
10.3.5	Engineering Consideration for the Selection of the Various Components of Rankine Cycle .....	401
10.3.5.1	Expanders and Pumps .....	401
10.3.5.2	Heat Exchangers .....	403
10.4	Power Generation Using Hybrid Heating of Rankine Cycle .....	404
10.5	Power Generation Using Organic Rankine Cycle Coupled to a Solar Pond .....	406
10.6	Power Generation Using the Brayton Cycle .....	406
10.7	Optimum Collector Temperature for the Solar-Operated Power Cycle ..	407

10.7.1	Low Temperature Solar Collectors	407
10.7.2	High Temperature Solar Collectors	408
10.7.3	Various Types of Solar Collectors	409
10.8	Power Tower Technology	409
10.8.1	Concept	409
10.8.2	Heliostat Field Layout	412
10.8.3	Tilt Angles and Orientations of Heliostats	420
10.8.4	Sizing of Receiver	424
10.8.5	Types of Receivers	429
10.8.6	Review of Some Central Receiver Systems	429
	Nomenclature	429
	Problems	432
	References	433

### Appendices

B.	Equilibrium Property Data Equations for $\text{NH}_3\text{-H}_2\text{O}$ Solution	439
C.	Values of Latitude and Longitude Angles of Some Major Cities Around the World	441

Solar thermal power plants are active systems, and while there are a few types, there are a few basic similarities: Mirrors reflect and concentrate sunlight, and receivers collect that solar energy and convert it into heat energy. A generator can then be used to produce electricity from this heat energy. Advertisement. The most common type of solar thermal power plants, including those plants in California's Mojave Desert, use a parabolic trough design to collect the sun's radiation. These collectors are known as linear concentrator systems, and the largest are able to generate 80 me Professional simulation program for the planning and design of solar thermal systems. ESOP Solar Simulation Program. What is ESOP? ESOP NA 4.0 is a solar simulation program designed to assist solar professionals with the planning and design of Viessmann solar systems. The program comes with 12 standard system configurations for solar DHW, solar pool heating, and combination systems that include DHW, spacing heating and/or pool heating. ESOP includes climate data for locations across North America as well as product specifications for all Viessmann solar collectors, DHW storage tanks, and boile Design of a solar thermal powered cooling system. Degree Programme Degree Programme in Wellness Technology. Tutors(s) MATILAINEN, Jorma. Assigned by Robert Bosch GmbH DANNE, Thomas Abstract.Â The work was based on a process which was already proven thermally ecient by experimental tests of a prototype. The thesis was carried out in the group "Solar Systems" which belongs to the "Corporate Research" unit of the company Robert Bosch GmbH. In southern Europe, to maintain comfortable inside air conditions, inecient electronically driven cooling methods are used in a large scale during the relatively hot summers. Simultaneously with high cooling demands, usually intensive solar radiation is present.
